

What is Artificial Intelligence (AI)?

Artificial Intelligence (AI) is a branch of computer science that focuses on creating machines and systems that can perform tasks that normally require human intelligence. These tasks include learning from data, reasoning, problem-solving, decision-making, speech recognition, image understanding, and natural language processing.

AI systems use algorithms and models to analyze large amounts of data, identify patterns, and make intelligent decisions without explicit human intervention. Machine Learning and Deep Learning are subfields of AI that enable systems to improve their performance automatically through experience and data.

In simple terms, AI makes computers **think and act like humans** in an intelligent manner.
